THE AIRMAN'S EYES

AFFECTED BY STRONG LIGHT,
SO-CALLED "SNOW-BLINDNESS"
SPECIALLY CARE DODGERS.

After three weeks of flying almost in a state of exhaustion, he said that this condition may be attributed to his eyesight, which was not good when he joined the Navy, but which is believed to improve by degrees as he gets more experience.

The models from which the airmen has selected the most popular are those which are most effective in use with snow, but the effect of the sun's rays on the shorter portion of the atmosphere—such as when the intense sunlight goes through the light clouds—definitely lessens the value.

Experiments are being conducted by Dr. F. W. Frazer, Associate Material Engineer, under the direction of the Woodwind and Culverhouse Metal Fatigue Engineers, to determine the best way to make a glass that will protect the air man's eyes against the intense sunlight. The glasses to be used for flying are produced in two styles—their effect varies somewhat.

When the pilot takes his glasses off, he finds that his eyes are fatigued, but they are not strained.

When the pilot takes his glasses off, he finds that his eyes are fatigued, but they are not strained.

When the pilot takes his glasses off, he finds that his eyes are fatigued, but they are not strained.
